

Operating manual for Multi Colour Ceramic Light Engine (L.E.D.) lights.

There are 10 different colour programs available for use with your multi colour light.

The colour programs are as follows:

1. Blue.
2. Magenta.
3. Red.
4. Lime.
5. Green.
6. Aqua.
7. Cool White.
8. Warm White.
9. Multi colour – STAGE 1 – (Colours 1 to 6 blend in a gradual transition from colour to colour over a seven second sequence).
10. Multi colour – STAGE 2 – (Colours 1 to 7 change in a rapid succession over a three second sequence).

To step between colours, simply turn your light switch off and wait for two seconds before turning on again and your light will change to the next colour program.

Reset Function:

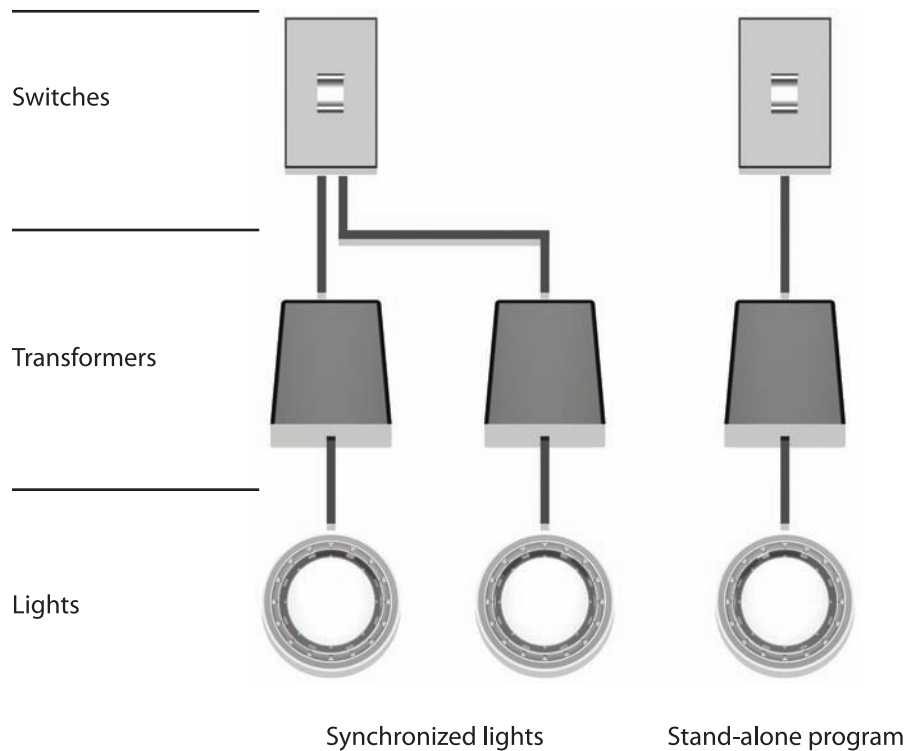

The light has been provided with a reset function that will only be necessary when using multiple lights which have failed to colour synchronize.

When resetting your lights:

Step 1. Start with the lights on, then switch them off and back on again rapidly.

Step 2. The lights will all start flashing blue to indicate that they can now be reset.

Step 3. Turn off the lights for two minutes and then back on again, all the lights will now start at solid blue indicating that they are reset and ready for normal operation.

Installation Note:

When installing more than one light, to ensure synchronization of your lights, all pool light transformers must be controlled by a single isolation switch.

If you require a further light/s to be operated separately from the main lights i.e. a spa light, you must install the additional light/s on a separate transformer and isolating switch.
